Summary

Senior software engineer with 7+ years of experience building backend and data-intensive systems in Python and Scala on top of PostgreSQL. I own features end to end: schema design, APIs, testing, CI/CD and AWS deployment. Background in REST services, asynchronous processing and robotics fleet management, now working full stack with React. I mentor engineers, interview candidates, and use AI coding agents (Claude, ChatGPT, GitHub Copilot) daily to ship faster without lowering the review bar.

Experience

Jan 2026 – present **Senior Full Stack Software Engineer**, *Zanders*, Zagreb

- Build and maintain features across a Python (FastAPI, SQLAlchemy) backend and a React/TypeScript frontend (Vite, MUI).
- Work closely with product and design teams to translate requirements into technical specifications and implement features accordingly.
- Keep quality high with static analysis, type checking and automated tests enforced in CI.

Mar 2024 – Jan 2026 **Backend Software Engineer**, *GlobalLogic*, Zagreb

- Designed and maintained high-performance backend services in Scala with the Play Framework as part of a distributed system, improving reliability and scalability.
- Optimised PostgreSQL schemas and queries, reducing data access latency and raising overall throughput.
- Wrote unit and integration tests for every feature; automated builds and delivery with GitLab CI/CD.
- Deployed, monitored and scaled services on AWS for high availability and cost efficiency.
- Mentored junior developers on software design and code quality, and conducted technical interviews.

Jun 2021 – Mar 2024 **Robotics Software Engineer (previously Backend Developer)**, *Gideon*, Zagreb

- Developed applications and libraries to manage a fleet of warehouse robots in Python with FastAPI, Pydantic and asyncio, and contributed to the architecture of the system.
- Designed several PostgreSQL databases and implemented multithreaded and multiprocess systems.
- Took over the three-component "Over the Air (OTA) Update" feature and significantly improved it on both frontend and backend.
- Wrote unit, functional and integration tests, automated them in a CI/CD pipeline and verified software on real robots in a test warehouse.
- As Backend Developer: built a REST API in Python (Flask) on PostgreSQL, ran heavy asynchronous jobs with Celery, and contributed to the Angular/TypeScript frontend.
- Used Jira, Confluence, GitLab CI and Docker daily, and kept documentation up to date.

Jan 2019 – Jun 2021 **Full Stack Developer**, *Digihey*, Zagreb

- Rewrote a legacy Angular/Ionic cross-platform app on the current stack with NgRx (Redux pattern) and released it to Google Play and the App Store.
- Rewrote a legacy Scala/Play backend to fit the mobile app and admin panel better, with less code and better performance.
- Built an Angular admin dashboard from scratch and upgraded two React/GatsbyJS (GraphQL) projects.
- Deployed servers with Nginx and Let's Encrypt SSL, automated routine work with shell scripts, and worked directly with a client in Switzerland.

Skills

Languages	Python, Scala, TypeScript, SQL; also Java, JavaScript, Dart, Solidity, C
Backend	FastAPI, Flask, Play Framework, http4s, Cats / Cats Effect, Akka, Celery, Pydantic, asyncio, Node.js
Data	PostgreSQL (schema design, query optimisation), MySQL, MongoDB, Redis, SQLAlchemy, Slick, Doobie
Frontend & mobile	React, Angular, NgRx, Ionic, Flutter
Cloud & DevOps	AWS, Docker, GitLab CI/CD, Nginx, Linux, macOS
AI tooling	Claude and Claude Code, ChatGPT, GitHub Copilot, Model Context Protocol (MCP)
Practices	Clean architecture, test automation, code review, mentoring, Jira, Confluence

Projects

Oct 2026 **Doer**, *React, TypeScript, Hono, Cloudflare Workers, Neon Postgres, Drizzle, Tauri*

- Daily task tracker with work and private profiles, reminders, a calendar view and Google Calendar sync. Ships as a web app and a macOS desktop app from one pnpm/Turborepo monorepo, with an offline cache that queues writes. github.com/MartinPavic/Doer

Oct 2026 **ShipLog**, *Next.js, TypeScript, Postgres, Drizzle, Clerk, Stripe, OpenAI/Anthropic*

- SaaS that turns GitHub commits, pull requests and releases into AI-written changelogs, standups and client reports, with streaming generation, shareable links, scheduled delivery to Slack, Discord and email, teams and Stripe billing. github.com/MartinPavic/ShipLog

Oct 2026 **Abracadabra**, *Tauri, Rust, React, TypeScript*

- Desktop app that turns assigned GitLab/GitHub issues into reviewed branches: a worker and reviewer coding-agent pipeline runs in an isolated git worktree, and the result waits for human approval. github.com/MartinPavic/Abracadabra

Oct 2026 **Portfolio website**, *Astro, TypeScript, Tailwind CSS, Cloudflare*

- Static site with typed content collections, deployed on Cloudflare. portfolio-1gc.pages.dev

Oct 2022 **Brezovica App**, *Flutter, Dart, Contentful, Supabase*

- Mobile app for the Brezovica community in Zagreb that lets citizens send feedback to local authorities. github.com/MartinPavic/brezovica

Jul 2021 **Martin's Blockchain**, *Master's thesis; Hyperledger Fabric, TypeScript, Angular, Node.js*

- Permissioned blockchain for sharing fungible tokens (messroom points) and non-fungible tokens (rector's awards), implemented as smart contracts. github.com/MartinPavic/MartinsBlockchain

Education

Oct 2016 – Jul 2021 **Master's degree, Computer Science**, *University of Zagreb, FER*, Zagreb
Thesis: Permissioned blockchain and distributed ledger technologies with smart contracts

Sep 2012 – Jun 2016 **High school**, *MIOC*, Zagreb
